

EXP1 §Phase B — WGS genome-wide aggregation (24 chromosomes, ~2.7 billion positions)

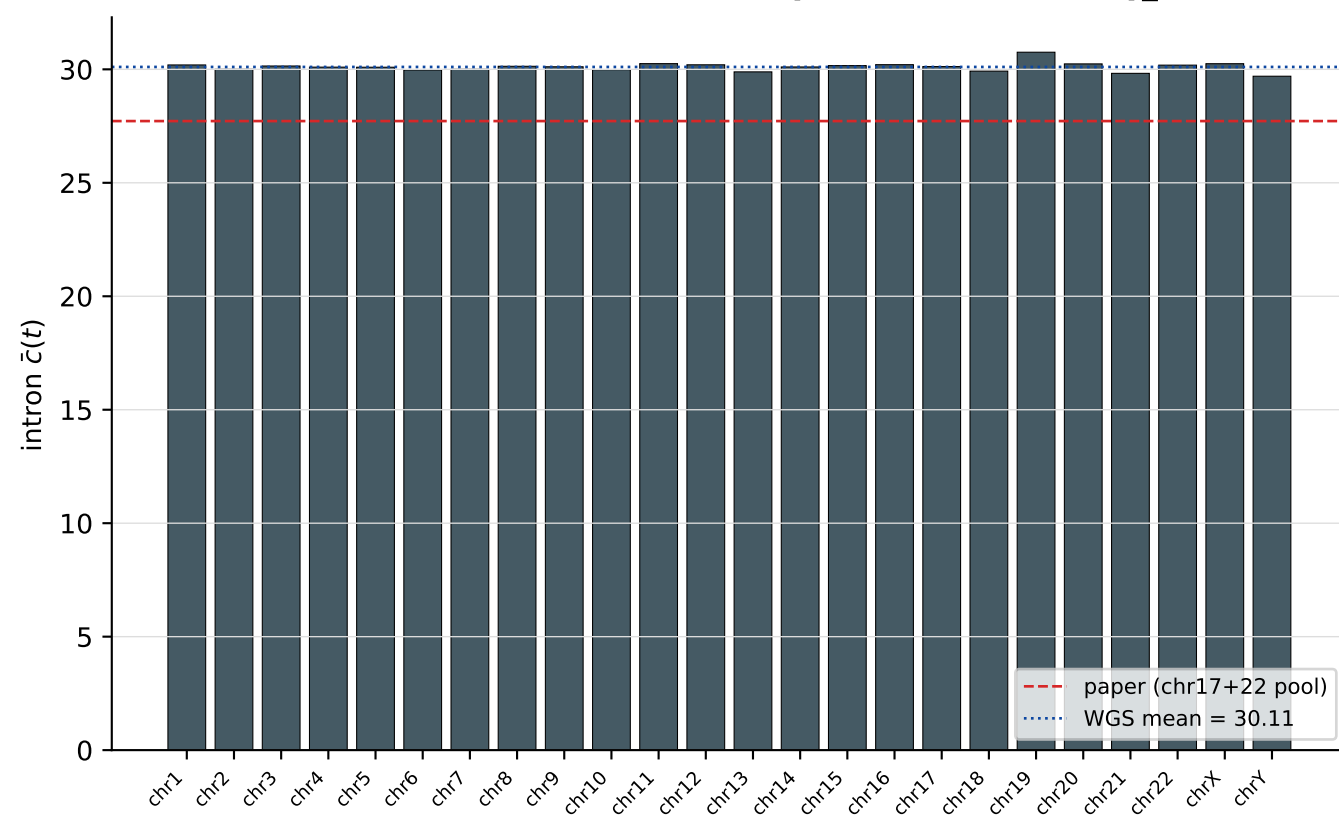

(a) WGS vs paper §3.1 — per-context mean $\bar{c}(t)$

(b) WGS effect sizes: $c(t) + \text{osil}$, error bars = per-chr SD

(c) Calibration robustness: intron $\bar{c}(t)$ per chromosome ($\gamma_{\text{cos}}=0.397$ frozen)

(d) Per-chr splice sites in $c(t) \times \text{osil}$ plane (H3a orthogonal-axes replication)
